Automated screenshots of G3ZIL 7MHz WSPR receiver (WSJT-X on Raspberry Pi 3 via Screen Sharing on a Mac). The cron script on the Mac is set to take a screen shot every hour at 30 minutes past the hour (barring a few hiccups - the Mac must not sleep and the window must be visible). Times are UTC, rounded to nearest minute, and represent the time of the screenshot. Manual adjustment was made when required to the input level to keep at ~30dB (during daytime).
